# Applications

This product is designed for direct installation into the factory oil pans of the following vehicles:

- 1997-2000 Holden Commodore VT Series II, 5.7L V8 (LS1)
- 2000-2002 Holden Commodore VX, 5.7L V8 (LS1)

# Installation Instructions

 **Warning:** This product should only be installed by a qualified mechanic. Improper installation could result in severe engine damage.

1. Wash the oil pan baffle with a degreaser or ordinary dish soap to remove any contaminants that may damage the engine. Rinse and dry with a lint-free towel.

 **Warning:** Failure to properly clean the baffle can lead to engine damage.

2. Drain the engine oil and remove the oil filter.
3. Refer to the instructions in the vehicle's factory service manual to remove the oil pan.

**Important:** Do not remove the factory windage tray/baffle, which bolts to the main caps. The oil pan baffle is designed to work in conjunction with the windage tray.

4. Unbolt the factory oil pan baffle by removing the bolts that secure it to the oil pan using a 10 mm hex socket. These bolts will be reused.
5. Clean the oil pan thoroughly to remove any oil residue and sludge buildup.
6. Secure the Improved Racing baffle to the pan with the bolts removed in step 4 and torque them down to approximately 106 in-lbs (8-9 ft-lbs).

**Important:** Make sure all of the trap doors open and close freely. If they do not, discontinue installation and contact Improved Racing for assistance.

7. *Optional:* Replace the oil pan gasket and pickup tube O-ring with new components. This step is recommended for higher mileage engines.
8. Refer to the instructions in the vehicle's factory service manual to re-install the oil pan.
9. Replace the oil filter, tighten the drain plug and refill the sump with oil to the factory-recommended level.

***Congratulations!*** You can now benefit from improved oil control. For best results, follow the recommendations on Page 3.

## Use and Precautions – *Please Read!*

**Important:** NEVER let the oil level drop below the *full* mark at the race track!

This product is designed to provide superior protection against oil starvation and slosh over the stock oil pan baffle. The sources of oil starvation are varied and this product will not protect your engine from damage in all circumstances.

### **Please follow these recommendations:**

- Install an oil pressure gauge with a low-pressure alarm the driver can hear or see. This is critical for preventing catastrophic engine damage and will help determine the limits of your setup.
- We recommend overfilling the sump by ½ quart prior to track events.
- Always top off oil levels between track sessions. Do not allow the oil level to drop below the full mark.
- If oil pressure drops still occur, consider adding an oil accumulator and overfilling the sump by up to 1 quart.
- Vehicles that sustain over 1.4 lateral G's (significant aerodynamic assists and/or racing compound tires) and vehicles with high shift points should use a dry sump oiling system.

### **Exhaust smoke:**

- When racing with an overfilled sump, it is common to see white or bluish smoke exiting the exhaust system. This is caused by excess oil entering the intake through the PCV system. We recommend installing an oil catch can on the PCV line to prevent this from happening.

### **Draining the oil:**

- Run the engine for 2-3 minutes before draining the oil. This will help drain metal particles by suspending them in the oil prior to draining.
- Draining the oil with the baffle installed will take longer than usual. Allow the sump to drain for at least 10 minutes to ensure all of the oil has been removed.
